DIGII BRO — FREE CREATOR TOOLS

Audio to SRT Tool
User Guide

Turn any audio or voiceover into a ready-to-use SRT subtitle file — fast, accurate, and editable — right inside your browser.

100% FREE | NO SIGN-UP FOR THE TOOL | WORKS IN CHROME

What This Tool Does

You upload an audio (or video) file, and the tool listens to it with AI and creates an **SRT subtitle file** with exact timings. You can then **edit every line**, re-split the subtitles your way, and download the finished SRT — plus a ready-made prompt that converts the Hindi text into **Roman Hinglish**.

The tool has **two engines**: **Groq** (fastest, best accuracy — needs a free API key, explained below) and **Browser Whisper** (runs fully inside your browser, no key at all). Your audio and your key never leave your browser except the copy sent to the engine you choose.

Part 1 — Get Your FREE Groq API Key (1 Minute)

An "API key" is just a free personal password that lets the tool use Groq's super-fast Whisper AI for you. Getting one is free — **no card, no payment**:

1. 1 Open **console.groq.com/keys** in Chrome.
2. 2 **Sign up / Log in** — it is free. You can continue with Google or with your email.
3. 3 You will land on the **API Keys** page. Click the **Create API Key** button (top right).
4. 4 Give it any name you like (for example: `srt`) and click **Submit**.
5. 5 Your key appears — it starts with `gsk_`. Click **Copy**. ⚠️ The full key is shown **only this one time**, so copy it carefully. (Lost it? Just create a new one the same way — it is free.)
6. 6 Come back to the tool and **paste the key** in Step 2, in the box labelled **"Your Groq API key"**.

> **Good to know:** the key is saved only in **your own browser** — the tool never sends it anywhere except to Groq itself. You will not need to paste it again on the same browser. Never post your key publicly (it is linked to your free account limits).

Part 2 — Make Your SRT File

1. 1 **Upload your file** (Step 1) — MP3, WAV, M4A, MP4, OGG or WEBM. Drag & drop, or click to choose. Long files are fine — very large files are automatically shrunk and sent in ~10-minute parts.
2. 2 **Choose the engine** (Step 2): keep **Groq** selected for the best result. Keep the model on **whisper-large-v3**, and set **Audio language** to match your voiceover (for Hindi/Hinglish voiceovers keep **Hindi**).

3. 3 Click **Transcribe** → **Build SRT** and wait a few seconds. Your subtitles appear in the editor.

No key? No problem: choose the **Browser Whisper** tab instead. The AI model downloads into your browser the first time (needs internet once), after that it even works offline. It is slower than Groq, but completely key-free.

Already have an SRT? Use **Import .SRT file** in Step 1 to load it straight into the editor for fixing and re-splitting.

Step 3 — Edit Your Subtitles

- **Click any segment** to hear exactly that part of your audio.
- **Fix mistakes** by typing directly in a segment's text box. You can also change its **start/end times**.
- **Split, merge, delete or add** segments with the buttons on each segment — and **+ Add segment** for a new one.
- **Find & Replace** fixes a repeated wrong word everywhere in one click.

Step 4 — Resegment (Re-split Your Way)

Want shorter lines for captions? Set **Max words per segment** (e.g. 6–8 for reel-style lines), **Max characters**, and **Max duration**, keep **Sentence-aware** on so lines break at sentence ends, and click **Apply Resegment**. It uses the stored word timings — **no re-transcribing needed**. Leave a box at 0 to ignore that limit.

Step 5 — Export

- **Convert Hindi → Hinglish (Free)** — do this first if your subtitles are in Hindi script: one click converts ALL subtitle text into **Roman Hinglish** right inside the tool, timings untouched. No other app, no AI chat needed. Changed your mind? The same button becomes **Undo** and brings the original Hindi back.
- **Download SRT** — the standard subtitle file for YouTube, Premiere, CapCut and caption tools.
- **Download VTT / TXT** — other formats if your app needs them.
- **Copy Hinglish Conversion Prompt** — optional extra polish: paste this prompt plus your SRT text into any AI chat (ChatGPT, Claude, Gemini…) and it returns the same SRT with the Hinglish conversion polished by AI, timings untouched.

> **Typical workflow:** voiceover → this tool (Groq) → edit → **Convert Hindi** → **Hinglish** → **Resegment** to short lines → **Download SRT** → use the SRT in the Digii Bro Hinglish Caption Tool for animated captions.

Troubleshooting

Problem	Fix
"Invalid API key" error	Re-copy the full key from Groq (it starts with `gsk_`) — make sure no space is added at the start or end when pasting.

"Rate limit" message	Groq's free limits are generous but real. Wait a little and try again — or switch to the **Browser Whisper** tab (no limits, no key).
Output is in the wrong language/script	Set **Audio language** correctly before transcribing (Hindi voiceovers → Hindi).
Transcription is slow	Groq is seconds-fast; Browser Whisper speed depends on your computer. Long files take proportionally longer — that is normal.
The tool does not respond / a button does nothing	Open the tool's real link directly in the **Chrome** browser (not inside another app's built-in preview/browser).
I lost my API key	No stress — go back to console.groq.com/keys and create a new one. Free, takes 30 seconds.

One honest note: accuracy depends on audio clarity. Clear voiceovers (like ElevenLabs voices) give near-perfect subtitles; noisy recordings may need a few quick fixes in the editor — that is exactly what the editor is for.
